

# 13.56-MHz multi-protocol contactless transceiver IC with SPI and UART serial access

Datasheet - production data

#### **Features**

- CR95HF belongs to the ST25 family which includes all ST's NFC/RFID tag and reader products
- · Operating modes supported:
  - Reader/Writer
- Hardware features
  - Dedicated internal frame controller
  - Highly integrated Analog Front End (AFE) for RF communications
  - Transmission and reception modes
  - Optimized power management
  - Tag Detection mode
- RF communication @13.56 MHz
  - ISO/IEC 14443 Type A and B
  - ISO/IEC 15693
  - ISO/IEC 18092
  - MIFARE® Classic compatible (a) (b)
- MIFARE and MIFARE Classic are registered trademarks of NXP B.V. and are used under license.
- Parity Framing mode is compatible with MIFARE® Classic requirements. However, access to Authenticated state must be supported by an external secure host which embeds the MIFARE® Classic library.

- Communication interfaces with a Host Controller
  - Serial peripheral interface (SPI) Slave interface
  - Universal asynchronous receiver/transmitter (UART)
  - Up to 528-byte command/reception buffer (FIFO)
- 32-lead, 5x5 mm, very thin fine pitch quad flat (VFQFPN) ECOPACK®2 package

#### **Applications**

Typical protocols supported:

- ISO/IEC 14443-3 Type A and B tags
- ISO/IEC 15693 tags
- ISO/IEC 18000-3M1 tags
- NFC Forum tags: Types 1, 2, 3 and 4
- ST short-range interface (SRI) tags
- ST long-range interface (LRI) tags
- ST Dual Interface EEPROM

CR95HF Description

## 1 Description

The CR95HF is an integrated transceiver IC for contactless applications.

The CR95HF manages frame coding and decoding in Reader mode for standard applications such as near field communication (NFC), proximity and vicinity standards.

The CR95HF embeds an Analog Front End to provide the 13.56 MHz Air Interface.

The CR95HF supports ISO/IEC 14443 Type A and B, ISO/IEC 15693 (single or double subcarrier) and ISO/IEC 18092 communication protocols.

The CR95HF also supports the detection, reading and writing of NFC Forum Type 1, 2, 3 and 4 tags.

21	ST_R1	I <sup>(8)</sup>	ST Reserved	
22	GND	Р	Ground (digital)	
23	NC		Not connected	
24	NC		Not connected	
25	NC		Not connected	
26	NC		Not connected	
27	NC		Not connected	
28	NC		Not connected	
29	XIN		Crystal oscillator input	
30	XOUT		Crystal oscillator output	
31	GND_TX	Р	Ground (RF drivers)	
32	VPS_TX	Р	Power supply (RF drivers)	

- 1. I: Input, O: Output, and P: Power
- 2. Must add a capacitor to ground (~1 nF).
- 3. Pad internally connected to a Very Weak Pull-up to VPS.
- 4. We recommend connecting this pin to the  $V_{PS}$  pin using a 3.3 kOhm pull-up resistor.
- 5. Pad internally connected to a Weak Pull-up to VPS.
- 6. Must not be left floating.
- 7. Pad internally connected to a Weak Pull-down to GND.
- 8. Pad input in High Impedance. Must be connected to VPS.

10/77 DocID018669 Rev 11

## 3 Power management and operating modes

## 3.1 Operating modes

The CR95HF has 2 operating modes: Wait for Event (WFE) and Active. In Active mode, the CR95HF communicates actively with a tag or an external host (an MCU, for example). WFE mode includes four low consumption states: Power-up, Hibernate, Sleep and Tag Detector.

The CR95HF can switch from one mode to another.

Table 3. CR95HF operating modes and states

Mode	State	Description
	Power-up	This mode is accessible directly after POR.  Low level on IRQ_IN pin (longer than 10 µs) is the only wakeup source. LFO (low-frequency oscillator) is running in this state.
	Hibernate	Lowest power consumption state. The <u>CR95HF</u> has to be woken-up in order to communicate. Low level on <u>IRQ_IN</u> pin (longer than 10 µs) is the only wakeup source.
Wait For Event (WFE)	Sleep	Low power consumption state. Wakeup source is configurable:  - Timer - IRQ_IN pin - SPI_SS pin LFO (low-frequency oscillator) is running in this state.
	Tag Detector	Low power consumption state with tag detection. Wakeup source is configurable:  - Timer  - IRQ_IN pin  - SPI_SS pin  - Tag detector  LFO (low-frequency oscillator) is running in this state.
Active	Ready	In this mode, the RF is OFF and the CR95HF waits for a command (PROTOCOLSELECT,) from the external host via the selected serial interface (UART or SPI).
Active	Reader	The CR95HF can communicate with a tag using the selected protocol or with an external host using the selected serial interface (UART or SPI).

Hibernate, Tag Detector, and Sleep states can only be activated by a command from the external host. As soon as any of these three states are activated, the CR95HF can no longer communicate with the external host. It can only be woken up.

The behavior of the CR95HF in 'Tag Detector' state is defined by the Idle command.

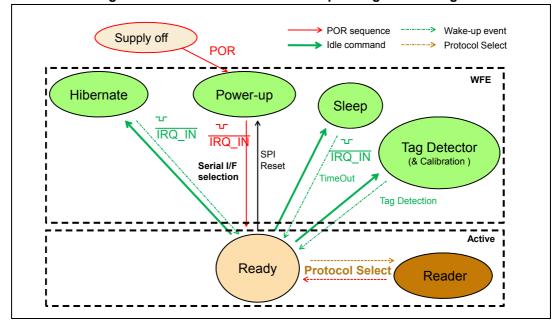

Figure 4. CR95HF initialization and operating state change

### 3.2 Startup sequence

Afte<u>r the power supply</u> is established at power-on, the CR95HF waits for a low pulse on the pin IRQ\_IN ( $t_1$ ) before automatically selecting the external interface (SPI or UART) and entering Ready state after a delay ( $t_3$ ).

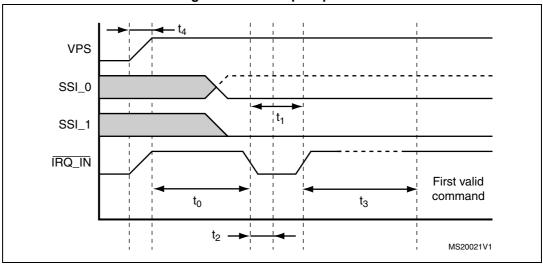

Figure 5. Power-up sequence

- 1. Note for pin SSI0: - SPI selected, —— UART selected
- 2. Pin  $\overline{\text{IRQ\_IN}}$  low level < 0.2 VPS\_Main.

Note: When CR95<u>HF leaves WFE mode (from Power-up, Hibernate, Tag Detector, or Sleep)</u> following an IRQ\_IN/RX low level pulse, this pulse is NOT interpreted as the UART start bit character.

57

12/77 DocID018669 Rev 11

Figure 5 shows the power-up sequence for a CR95HF device; where,

t<sub>0</sub> is the initial wake-up delay
 t<sub>1</sub> is the minimum interrupt width
 t<sub>2</sub> is the delay for the serial interface selection
 t<sub>3</sub> is the HFO setup time (t<sub>SU(HFO)</sub>)
 100 µs (minimum)
 250 ns (typical)
 10 ms (maximum)

•  $t_4$  is the  $V_{PS}$  ramp-up time from 0V to  $V_{PS}$  10 ms (max. by design validation)

Note: VPS

VPS must be 0V before executing the start-up sequence.

The serial interface is selected after the following falling edge of pin  $\overline{IRQ\_IN}$  when leaving from POR or Hibernate state.

Table 4 lists the signal configuration used to select the serial communication interface.

Table 4. Select serial communication interface selection table

Pin	Serial interface
SSI_0	UART: 0 SPI: 1
SSI_1	UART: 0 SPI: 0

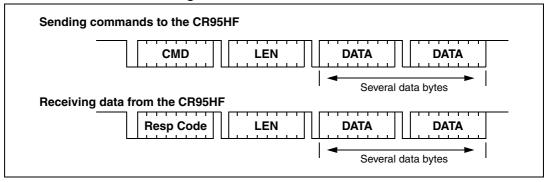

## 4 Communication protocols

### 4.1 Universal asynchronous receiver/transmitter (UART)

The host sends commands to the CR95HF and waits for replies. Polling for readiness is not necessary. The default baud rate is 57600 baud. The maximum allowed baud rate is 2 Mbps.

Figure 6. UART communication

When sending commands, no data must be sent if the LEN field is zero.

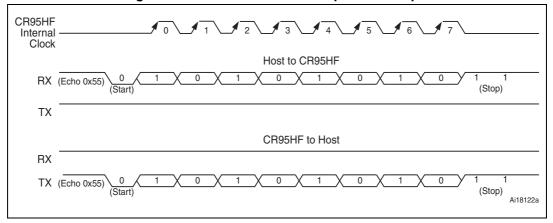

When receiving data from the CR95HF, no data will be received if the LEN field is zero.

The formats of send and receive packets are identical.

If an ECHO command is sent, only one byte (0x55) is sent by the host.

Figure 7 shows an example of an Echo command.

Figure 7. Echo command and response example

## Caution: UART communication is LSB first. Stop bit duration is two Elementary Time Units (ETUs).

Note: 1 When CR95HF leaves WFE mode (from Power-up, Hibernate, Sleep Detector or Tag Detector) following an IRQ\_IN/RX low level pulse, this pulse is NOT interpreted as the UART start bit character.

2 If the user loses UART synchronization, it can be recovered by sending an ECHO command until a valid ECHO reply is received. Otherwise, after a maximum of 528 ECHO commands,

14/77 DocID018669 Rev 11

CR95HF will reply with an error code meaning its input buffer is full. The user can now restart a UART exchange.

### 4.2 Serial peripheral interface (SPI)

#### 4.2.1 Polling mode

In order to send commands and receive replies, the application software has to perform 3 steps.

- 1. Send the command to the CR95HF.
- 2. Poll the CR95HF until it is ready to transmit the response.
- 3. Read the response.

The application software should never read data from the CR95HF without being sure that the CR95HF is ready to send the response.

The maximum allowed SPI communication speed is  $f_{SCK}$ .

A Control byte is used to specify a communication type and direction:

- 0x00: Send command to the CR95HF
- 0x03: Poll the CR95HF
- 0x02: Read data from the CR95HF
- 0x01: Reset the CR95HF

The SPI\_SS line is used to select a device on the common SPI bus. The SPI\_SS pin is active low.

When the SPI\_SS line is inactive, all data sent by the Master device is ignored and the MISO line remains in High Impedance state.

Figure 8. Sending command to CR95HF

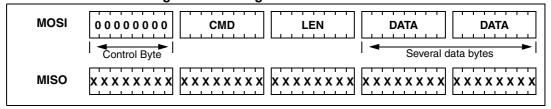

Figure 9. Polling the CR95HF until it is ready

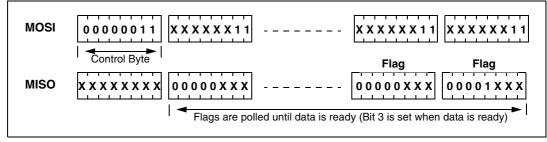

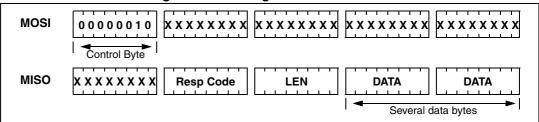

Table 5. Interpretation of flags

Bit	Meaning (Application point of view)
[7:4] Not significant	
3 Data can be read from the CR95HF when set.	
2 Data can be sent to the CR95HF when set.	
[1:0]	Not significant

Figure 10. Reading data from CR95HF

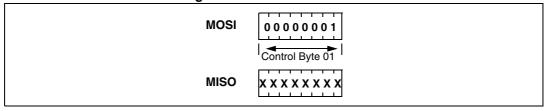

Data must be sampled at the rising edge of the SCK signal.

<u>'Sending'</u>, 'Polling' and 'Reading' commands must be separated by a high level of the SPI\_SS line. For example, when the application needs to wait for data from the CR95HF, it asserts the SPI\_SS line low and issues a 'Polling' command. Keeping the SPI\_SS line low, the Host can read the Flags Waiting bit which indicates that the CR95HF can be read. Then, the application has to assert the SPI\_SS line high to finish the polling command. The Host asserts the SPI\_SS line low and issues a 'Reading' command to read data. When all data is read, the application asserts the SPI\_SS line high.

The application is not obliged to keep reading Flags using the Polling command until the CR95HF is ready in one command. It can issue as many 'Polling' commands as necessary. For example, the application asserts SPI\_SS low, issues 'Polling' commands and reads Flags. If the CR95HF is not ready, the application can assert SPI\_SS high and continue its algorithm (measuring temperature, communication with something else). Then, the application can assert SPI\_SS low again and again issue 'Polling' commands, and so on, as many times as necessary, until the CR95HF is ready.

Note that at the beginning of communication, the application does not need to check flags to start transmission. The CR95HF is assumed to be ready to receive a command from the application.

Figure 11. Reset the CR95HF

To reset the CR95HF using the SPI, the application sends the SPI Reset command (Control Byte 01, see *Figure 11*) which starts the internal controller reset process and puts the CR95HF into Power-up state. The CR95HF  $\underline{\text{will wake}}$  up when pin  $\overline{\text{IRQ\_IN}}$  goes low. The CR95HF reset process only starts when the  $\overline{\text{SPI\_SS}}$  pin returns to high level.

Caution: SPI communication is MSB first.

16/77 DocID018669 Rev 11

### 4.2.2 Interrupt mode

When the CR95HF is configure to use the SPI serial interface, pin  $\overline{IRQ\_OUT}$  is used to give additional information to user. When the CR95HF is ready to send back a reply, it sends an Interrupt Request by setting a low level on pin  $\overline{IRQ\_OUT}$ , which remains low until the host reads the data.

The application can use the Interrupt mode to skip the polling stage.

Caution: SPI communication is MSB first.

#### 4.3 Error codes

Table 6. Possible error codes and their meaning

Code	Name	Meaning
0X63	EEmdSOFerror23	SOF error in high part (duration 2 to 3 etu) in ISO/IEC 14443B
0x65	EEmdSOFerror10	SOF error in low part (duration 10 to 11 etu) in ISO/IEC 14443B
0x66	EEmdEgt error	Extennded Guard Time error in ISO/IEC 14443B
0x67	ETr1 Too Big Too long	TR1 send by the card, reception stopped in ISO/IEC 14443BT
0x68	ETr1Too small Too small	TR1 send by the card in ISO/IEC 14443B
0x71	EinternalError	Wrong frame format decodes
0x80	EFrameRecvOK	Frame correctly received (additionally see CRC/Parity information)
0x85	EUserStop	Stopped by user (used only in Card mode)
0x86	ECommError	Hardware communication error
0x87	EFrameWaitTOut	Frame wait time out (no valid reception)
0x88	EInvalidSof	Invalid SOF
0x89	EBufOverflow	Too many bytes received and data still arriving
0x8A	EFramingError	if start bit = 1 or stop bit = 0
0x8B	EEgtError	EGT time out
0x8C	ElnvalidLen	Valid for ISO/IEC 18092, if Length <3
0x8D	ECrcError	CRC error, Valid only for ISO/IEC 18092
0x8E	ERecvLost	When reception is lost without EOF received (or subcarrier was lost)
0x8F	ENoField	When Listen command detects the absence of external field
0x90	EUnintByte	Residual bits in last byte. Useful for ACK/NAK reception of ISO/IEC 14443 Type A.

## 4.4 Support of long frames

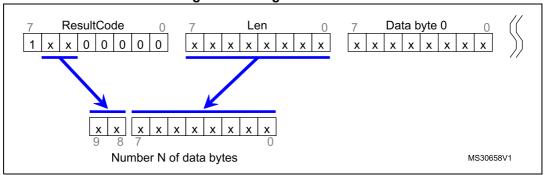

In Reader mode it is possible to receive up to 528 bytes of frame data from VICC and Type-B cards and up to 256 bytes of frame data from Type-A cards. In this case, the device sends a reply to the external MCU in the following format:

<ResultCode> + <Len> + <N bytes of data>

Table 7. Format of ResultCode

Bit	Meaning				
7	Always 1				
6	Bit 9 of Length				
5	Bit 8 of Length See examples and explanation below				
4	If set, there are residual bits in the last byte. Applicable only for Type-A protocol.				
3:0	Always 0				

Figure 12. Long frame format

The number of databytes is 10-bit long.

Table 8. Examples of ResultCode: Len pairs

ResultCode	Len	Length of data
0x80	0x00	0
0x80	0x01	1
0x80	0xFF	255
0xA0	0x00	256
0xA0	0x01	257
0xA0	0xFF	511
0xC0	0x00	512
0xC0	0x01	513

18/77 DocID018669 Rev 11

## 5 Commands

#### 5.1 Command format

The frame from the Host to the CR95HF has the following format:

<CMD><Len><Data>

• The frame from the CR95HF to Host has the following format:

<RespCode><Len><Data>

These two formats are available either in both UART and SPI modes.

Fields <Cmd>, <RespCode> and <Len> are always 1 byte long. <Data> can be from 0 to 253 bytes.

Note:

The ECHO command is an exception as it has only one byte (0x55).

The following symbols correspond to:

>>> Frame sent by the Host to CR95HF

<<< Frame sent by the CR95HF to the Host

#### 5.2 List of commands

Table 9 summarizes the available commands.

Table 9. List of CR95HF commands

Code	Command	Description
0x01	IDN	Requests short information about the CR95HF and its revision.
0x02	PROTOCOLSELECT	Selects the RF communication protocol and specifies certain protocol-related parameters.
0x04	SendRecv	Sends data using the previously selected protocol and receives the tag response.
0x07	IDLE	Switches the CR95HF into a low consumption Wait for Event (WFE) mode (Power-up, Hibernate, Sleep or Tag Detection), specifies the authorized wake-up sources and waits for an event to exit to Ready state.
0x08	RdReg	Reads Wake-up event register or the Analog Register Configuration (ARC_B) register.
0×09	WRREG	Writes Analog Register Configuration (ARC_B)) register or writes index of ARC_B register address.  Writes the Timer Window (TimerW) value dedicated to ISO/IEC 14443 Type A tags.  Writes the AutoDetect Filter enable register dedicated to ISO/IEC 18092 tags.
0x0A	BaudRate	Sets the UART baud rate.
0x55	Echo	CR95HF returns an Есно response (0x55).
(	Other codes	ST Reserved

## 5.3 IDN command (0x01) description

The IDN command (0x01) gives brief information about the CR95HF and its revision.

Table 10. IDN command description

Direction	Data	Comments	Example
Host to	0x01	Command code	00100
CR95HF	0x00	Length of data	>>>0x0100
	0x00	Result code	<<0x000F4E4643204653324A415354
	<len></len>	Length of data	34002ACE
	<device id=""></device>	Data in ASCII format (13 bytes)	In this example,
CR95HF to		bytes)	<<0x4E4643204653324A4153543400
Host	<rom crc=""></rom>	CRC calculated for ROM content (2 bytes)	: 'NFC FS2JAST4', #4 (Last Character of NFC FS2JAST4 means ROM code revision 4.)  0x2ACE: CRC of ROM (real CRC may differ from this example)

It takes approximately 6 ms to calculate the CRC for the entire ROM. The application must allow sufficient time for waiting for a response for this command.

## 5.4 Protocol Select command (0x02) description

This command selects the RF communication protocol and prepares the CR95HF for communication with a contactless tag.

Table 11. PROTOCOLSELECT command description

Direction	Data	Comments	Example	
	0x02	Command code		
	<len></len>	Length of data

Table 11. PROTOCOLSELECT command description (continued)

Direction	Data	Comments	Example
CR95HF to	0x83	Error code	<<<0x8300
Host	0x00	Length of data	Invalid protocol

Note that there is no 'Field ON' command. When the application selects an RF communication protocol, the field automatically switches ON .

When the application selects a protocol, the CR95HF performs all necessary settings: it will choose the appropriate reception and transmission chains, switch ON or OFF the RF field and connect the antenna accordingly.

Different protocols have different sets of parameters. Values for the <Parameters> field are listed in *Table 12*.

Table 12. List of <Parameters> values for the ProtocolSelect command for different protocols

Protocol	Code	Parameters		Parameters	Examples of commands
		Byte	Bit	Function	Examples of commands

ISO/IEC 18092			0	Append CRC if set to '1'.	commands, byte 1 bit 4 must be set to '0'. In this case, the FWT is 2.4 ms for the 1st slot
		1	7:5	RFU	and 1.2 ms more for each
NFC Forum Tag Type 3			4	0: FWT = 2.4 ms 1: FWT is specified by PP:MM bits	following slot, if slot counter is specified.
			3:0	Slot counter 0: 1 slot 1: 2 slots F: 16 slots	If slot counter = 0x10, the CR95HF does not respect reply timings, but polls incoming data and searches a valid response during ~8.4 ms.
		2	7:0	PP	These 3 bytes are optional.
		3	7:0	MM	Default value PP:MM:DD: is 0 and corresponds to RWT
		4	7:0	DD (optional to PP:MM)	~302µs. RWT = (2^PP)*(MM+1)* (DD+128)*32/13.56µs

<sup>1.</sup> It is recommended to set this bit to '1'.

<sup>2.</sup> Not characterized.

## 5.5 Send Receive (SendRecv) command (0x04) description

This command sends data to a contactless tag and receives its reply.

Before sending this command, the Host must first send the PROTOCOLSELECT command to select an RF communication protocol.

If the tag response was received and decoded correctly, the <Data> field can contain additional information which is protocol-specific. This is explained in *Table 14*.

Table 13. SENDRECV command description

Direction	Data	Comments	Example

<sup>1.</sup> Result code 90: Response is decoded but number of byte is not an integer.

<sup>2.</sup> For more information on using split frames, refer to Appendix D on page 58.

For more detailed examples of use with NFC Forum and ISO/IEC 15693 tags, refer to *Appendix D on page 58*.

If Parity Framing mode is used, the parity bit stays unchanged. On transmission, it is not encoded and on reception it is not decoded. The length of Data must be even. Each data byte is accompanied by an additional byte which encodes the parity:

```
<DataByte>, <Parity>, <DataByte>, <Parity> ...
```

Table 16. Structure of Parity byte

Bit	Description			
7	Parity bit			
[6:0]	Reserved for future use			

On reception, bits [6:0] of the parity byte are zeroes; on transmission, bits [6:0] are ignored.

### 5.6 Idle command (0x07) description

This command switches the CR95HF into low consumption mode and defines the way to return to Ready state.

The Result code contains the Wake-up flag register value indicating to the application the wake-up event that caused the device to exit WFE mode.

Table 17. IDLE command description

#### 5.6.1 Idle command parameters

The Idle command (Host to CR95HF) has the following structure (all values are hexadecimal):

Table 18. Idle command structure

07	0E	XX	yy zz	yy zz	yy zz	aa	bb	cc	dd ee	ff	aa
Comma nd code	Data	WU	Enter	WU	Leave	WU	Osc	DAC	DAC	Swing	Max
	length	source	Control	Control	Control	Period	Start	Start	Data	Count	Sleep

Table 19. Summary of Idle command parameters

Parameter	Description					
Command code	This byte is the command code. '07' represents the Idle command. This command switches the device from Active mode to WFE mode.					
Data length	This byte is the length of the command in bytes. Its value depends on the following parameter values.					
WU Source	This byte defines the authorized wake-up sources in the Wake-up source register. Predefined values are:  0x01: Time out 0x02: Tag Detection 0x08: Low pulse on IRQ_IN 0x10: Low pulse on SPI_SS					
Enter Control	These two bytes (EnterCtrlL and EnterCtrlH) define the resources when entering WFE mode.  0x0400: Hibernate 0x0100: Sleep (or 0x2100 if Timer source is enabled) 0xA100: Tag Detector Calibration 0x2100: Tag Detection					
WU Control	These two bytes (WuCtrlL and WuCtrlH) 0x0400: Hibernate 0xF801: Tag Detector Calibration	0x3800: <b>Sleep</b>				

An initial calibration is necessary to determine DacDataL and DacDataH values required for leaving Tag Detector state. For more information, contact your ST sales office for the corresponding application note.

Table 19. Summary of Idle command parameters (continued)

Parameter	Description					
Leave Control	These two bytes (LeaveCtrlL and LeaveCtrlH) define the resources when returning to Ready state.  0x1800: Hibernate 0x1800: Sleep  0x1800: Tag Detector Calibration 0x1800: Tag Detection					
WU Period	This byte is the coefficient used to adjust the time allowed between two tag detections. Also used to specify the duration before Timeout. (Typical value: 0x20)  Duration before Timeout = 256 * t <sub>L</sub> * (WU period + 2) * (MaxSleep + 1)					
Osc Start	This byte defines the delay for HFO stabilization. (Recommended value: 0x60)  Defines the Wait time for HFO to stabilize: <0scStart> * tL					
DAC Start	This byte defines the delay for DAC stabilization. (Recommended value: 0x60)  Defines the Wait time for DAC to stabilize: <dacstart> * tL</dacstart>					
DAC Data	These two bytes (DacDataL and DacDataH) define the lower and higher comparator values, respectively. These values are determined by a calibration process.  When using the demo board, these values should be set to approximately 0x64 and 0x74, respectively.					
Swing Count	This byte defines the number of HF swings allowed during Tag Detection. (Recommended value: 0x3F)					
Max Sleep	This byte defines the maximum number of tag detection trials or the coefficient to adjust the maximum inactivity duration before Timeout. MaxSleep must be: $0x00 < MaxSleep < 0x1F$ This value must be set to $0x01$ during tag detection calibration. Also used to specify duration before Timeout. Duration before Timeout = $256 * t_L * (WU period + 2) * (MaxSleep + 1) (Typical value: 0x28)$					

### 5.6.2 Using LFO frequency setting to reduce power consumption

In WFE mode, the high frequency oscillator (HFO) is stopped and most processes being executed are clocked by the low frequency oscillator (LFO). To minimize CR95HF power consumption in WFE mode, the slower the LFO frequency, the lower the power consumption.

#### **Example 1**: Setting a lower LFO frequency

The following equation defines a basic timing reference:

 $t_{REF} = 256*t_{L} \text{ ms (where } t_{L} = 1/f_{LFO})$ 

 $t_{RFF}$  = 8 ms (when bits [7:6] are set to "00", or 32 kHz)

 $t_{REF}$  = 64 ms (when bits [7:6] are set to "11", or 4 kHz)

#### 5.6.3 Optimizing wake-up conditions

Using the Wake-up source register, it is possible to cumulate sources for a wake-up event. It is strongly recommended to always set an external event as a possible wake-up source.

To cumulate wake-up sources, simply set the corresponding bits in the Wake-up source register. For example, to enable a wake-up when a tag is detected (bit 1 set to '1') or on a low pulse on pin IRQ\_IN (bit 3 set to '1'), set the register to 0x0A.

#### 5.6.4 Using various techniques to return to Ready state

The Idle command and reply set offers several benefits to users by enabling various methods to return the CR95HF to Ready state. Some methods are nearly automatic, such as waiting for a timer overflow or a tag detection, but others consume more power compared to the ones requesting a host action. A description of each method follows below.

#### Default setting: from POR to Ready state

After power-on, the CR95HF enters Power-up state.

To wake up the CR95HF and set it to Ready state, the user must send a low pulse on the IRQ\_IN pin. The CR95HF then automatically selects the external interface (SPI or UART) and enters Ready state and is able to accept commSands after a delay of approximately 6 ms (t<sub>3</sub>).

#### From Ready state to Hibernate state and back to Ready state

In Hibernate state, most resources are switched off to achieve an ultra-low power consumption.

The only way the CR95HF can wake-up from Hibernate state is by an external event (low pulse on pin IRQ\_IN).

A basic Idle command is:

```
>>>0x07 0E 08 04 00 04 00 18 00 00 00 00 00 00 00 00
```

Note:

The Wake-up flag value is NOT significant when returning to Ready state from Hibernate state or after a POR.

#### From Ready state to Sleep state and back to Ready state

Wake-up by external event (low pulse on IRQ\_IN or SPI\_SS pin)

In Sleep or Power-up states, operating resources are limited in function of the selected wake-up source to achieve a moderate power consumption level.

An Idle command example when wake-up source is pin IRQ IN:

```
>>>0x07 0E 08 01 00 38 00 18 00 00 60 00 00 00 00 00
```

A similar command can be implemented using pin SPI SS as a wake-up source:

```
>>>0x07 0E 10 01 00 38 00 18 00 00 60 00 00 00 00 00
```

#### Wake-up by timeout

The LFO is required to use the timer. However, this increases the typical power consumption by 80  $\mu$ A. Several parameters can be modified to reduce power consumption as much as possible.

57

The Duration before Timeout is defined by parameters WU period and MaxSleep, respectively 0x60 and 0x08 in the following example.

Duration before Timeout = 256 \* t<sub>1</sub> \* (WU period + 2) \* (MaxSleep + 1)

Note:

Note that: 0x00 < MaxSleep < 0x1F.

An Idle command example when wake-up source is timer ( $0 \times 01$ ) when  $f_{LFO}$  = 32 kHz (mean power consumption is 25  $\mu$ A)

```
>>>0x07 0E 01 21 00 38 00 18 00 60 60 00 00 00 00 08
```

An Idle command example when wake-up source is timer (0xC1) when  $f_{LFO}$  = 4 kHz (mean power consumption is 20  $\mu$ A):

```
>>>0x07 0E C1 21 00 38 00 18 00 60 60 00 00 00 00 08
```

The same command can be used mixing a timer and the  $\overline{IRQ\_IN}$  pin (0xC9) as a wake-up source:

```
>>>0x07 0E C9 21 00 38 00 18 00 60 60 00 00 00 00 08
```

#### Wake-up by Tag Detection

In this mode, the typical consumption can greatly vary in function of parameter settings (WU period without RF activity and Swing Count defining the RF burst duration). Using default settings, consumption in the range of 100  $\mu$ A can be achieved.

Tag Detector is a state where CR95HF is able to detect an RF event, a wake-up will occur when a tag sufficiently modifies the antenna load and is detected by the CR95HF.

An Idle command example when wake-up source is Tag Detection (0x02):

```
>>>0x07 0E 02 21 00 79 01 18 00 20 60 60 64 74 3F 08
```

The same command can be used mixing Tag Detection and the  $\overline{IRQ\_IN}$  pin (0x0A) as a wake-up source:

```
>>>0x07 0E 0A 21 00 79 01 18 00 20 60 60 64 74 3F 08
```

The tag detection sequence is defined by dedicated parameters:

- WU source (Byte 3) (Wake-up source register on page 53)
  - The Timeout bit (bit 0) must be set to '1' in order to manage a certain number of emitted bursts. Otherwise, bursts will be sent indefinitely until a stop event occurs (for example, tag detection or a low pulse on pin IRQ IN).
  - The Tag Detect bit (bit 1) must be set to '1' to enable RF burst emissions.
  - It is recommended to also set Bits 3 or 4 to '1' to ensure that it is possible to leave Tag Detect mode via an external event (for example, a low pulse on pin IRQ IN).
- WU period (Byte 10): Defines the period of inactivity (t<sub>INACTIVE</sub>) between two RF bursts:

```
t_{INACTIVE} = (WuPeriod + 2) * t_{REF}
```

• OscStart, DacStart (Bytes 11 and 12): Define the set-up time of the HFO and Digital Analog Converter, respectively. In general, 3 ms is used both set-up times.

```
HFO | DAC set-up time = (OscStart | DacStart) * t<sub>L</sub>
```

- DacDataL, DacDataH (Bytes 13 and 14): Reference level for Tag Detection (calculated during the tag detection calibration process).
- SwingsCnt (Byte 15): Represents the number of 13.56-MHz swing allowed during a Tag Detection burst. We recommend using 0x3F.

Maxsleep (Byte 16): The CR95HF emits (MaxSleep +1) bursts before leaving Tag
Detection mode if bit 0 (Timer Out) of the WU source register is set to '1'. Otherwise,
when this bit is set to '0', a burst is emitted indefinitely.

Note:

Bytes 4 to 9 should be used as shown in the examples in Section 5.6: Idle command (0x07) description.

Note that the MaxSleep value is coded on the 5 least significant bits, thus: 0x00 < MaxSleep < 0x1F.

All the previously described command parameters must be chosen accordingly for the initial tag detection calibration when setting up the CR95HF.

Their value will impact tag detection efficiency, and CR95HF power consumption during Tag Detection periods.

#### 5.6.5 Tag detection calibration procedure

The Idle command allows the use of a tag detection as a wake-up event. Certain parameters of the Idle command are dedicated to setting the conditions of a tag detection sequence.

During the tag detection sequence, the CR95HF regularly emits RF bursts and measures the current in the antenna driver  $I_{DRIVE}$  using the internal 6-bit DAC.

When a tag enters the CR95HF antenna RF operating volume, it modifies the antenna loading characteristics and induces a change in I<sub>DRIVE</sub>, and consequently, the DAC data register reports a new value.

This value is then compared to the reference value established during the tag detection calibration process. This enables the CR95HF to decide if a tag has entered or not its operating volume.

The reference value (DacDataRef) is established during a tag detection calibration process using the CR95HF application setting with no tag in its environment.

The calibration process consists in executing a tag detection sequence using a well-known configuration, with no tag within the antenna RF operating volume, to determine a specific reference value (DacDataRef) that will be reused by the host to define the tag detection parameters (DacDataL and DacDataH).

During the calibration process, DacDataL is forced to 0x00 and the software successively varies the DacDataH value from its maximum value (0xFE) to it minimum value (0x00). At the end of the calibration process, DacDataRef will correspond to the value of DacDataH for which the wake-up event switches from Timeout (no tag in the RF field) to tag detected.

To avoid too much sensitivity of the tag detection process, we recommend using a guard band. This value corresponds to 2 DAC steps (0x08).

Recommended guard band value:

DacDataL = DacDataRef - Guard and DacDataH = DacDataRef + Guard

The parameters used to define the tag detection calibration sequence (clocking, set-up time, burst duration, etc.) must be the same as those used for the future tag detection sequences.

When executing a tag detection sequence, the CR95HF compares the DAC data register value to the DAC Data parameter values (DacDataL and DacDataH) included in the Idle command. The CR95HF will exit WFE mode through a Tag Detection event if the DAC data register value is greater than the DAC Data parameter high value (DacDataH) or less than the DAC Data parameter low value (DacDataL). Otherwise, it will return to Ready state after a Timeout.

57

CR95HF Commands

An efficient 8-step calibration algorithm is described in *Example of tag detection calibration* process on page 54.

An example of a basic Idle command used during the Tag Detection Calibration process:

```
>>>0x07 0E 03 A1 00 F8 01 18 00 20 60 60 00 xx 3F 01
```

where xx is the DacDataH value.

An example of a tag detection sequence is provided in *Example of tag detection command using results of tag detection calibration on page 57*.

# 5.7 Read Register (RdReg) command (0x08) description

This command is used to read the Wakeup register.

Table 20. RDREG command description

Direction	Data	Comments	Example		
	0x08	Command code	Ex 1. >>>0x0803690100		
	0x03	Length of data	Reads the ARC_B register. (1)

Host	0x00	Length of data	-<<0x8200 Invalid command length		

<sup>1.</sup> This command must be preceded by the setting of the ARC\_B register index (0x0903680004).

Note:

The Management of the Analog Register Configuration register (ARC\_B) is described in Section 5.8: Write Register (WrReg) command (0x09) description.

Commands CR95HF

## 5.8 Write Register (WrReg) command (0x09) description

The Write Register (WRREG) command (0x09) is used to:

- set the Analog Register Configuration address index value before reading or overwriting the Analog Register Configuration register (ARC\_B) value
- set the Timer Window (TimerW) value used to improve CR95HF demodulation when communicating with ISO/IEC 14443 Type A tags
- set the AutoDetect Filter used to help synchronization of CR95HF with ISO/IEC 18092 tags
- configure the HF2RF bit<sup>(a)</sup> to manage I<sub>CC</sub> RF (V<sub>PS\_TX</sub>) consumption in Ready state

### 5.8.1 Improving RF performance

Adjusting the Modulation Index and Receiver Gain parameters helps improve application behavior.

The default value of these parameters ( $Table\ 24$ ) is set by the PROTOCOLSELECT command, but they can be overwritten using the Write Register (WRREG) command (0x09). Table 22 and Table 23 list possible values for the Modulation Index and Receiver Gain parameters respectively.

This new configuration is valid until a new PROTOCOLSELECT or Write Register (of register ARC\_B) command is executed. Register values are cleared at power off.

Direction	Data	Comments	Example
	0x09	Command code	
	0x03 <b>or</b> 0x04	Length of data	
	0x68	Analog Register Configuration address index	>>>0x090468010113 Update ARC_B value to 0x13
Host to CR95HF	0x00 <b>or</b> 0x01	Flag Increment address or not after Write command	>>>0x0903680001
	0x01	Index pointing to the Modulation Index and Receiver Gain values in the ARC_B register (0x01) (See Section 5.8.1)	Set Analog Register Index to 0x01 (ARC_B) (1)
	0xXX	New value for Modulation Index and Receiver Gain nibbles (See Section 5.8.1)	
CR95HF to	0x00	Result code	<<<0x0000

Table 21. WRREG command description (Modulation Index and Receiver Gain)

Length of data (= RegCount)

The default value of these parameters (*Table 24*) is set by the ProtocolSelect command, but they can be overwritten using the Write Register (WRREG) command ( $0 \times 0.9$ ).

577

Register written

38/77 DocID018669 Rev 11

0x00

Host

<sup>1.</sup> This command must be executed before reading the ARC\_B register (0x0803690100).

a. When the HF2RF bit is '0', Reader mode is possible (default mode). When set to '1', V<sub>PS\_TX</sub> power consumption is reduced (Ready mode).

CR95HF Commands

This new configuration is valid until a new PROTOCOLSELECT or Write Register (of register ) command is executed. Register values are cleared at power off.

### How to modify Analog Register Configuration register (ARC\_B) values

 Use the ProtocolSelect command (0x02) to select the correct communication protocol.

For example, to select the ISO/IEC 18092 protocol:

Send ProtocolSelect command: >>0x02020451 CR95HF reply: <<<0x0000

2. Read the Analog Register Configuration register (ARC\_B) value.

a) Write the ARC\_B register index at 0x01: >>>0x0903680001

**CR95HF reply:** <<<0x0000

b) Read the ARC\_B register value: >>>0x0803690100

**CR95HF reply**: <<<0x015F

In this example, the ARC\_B register value is 0x5F, where "5" is the Modulation Index and "F" is the Receiver Gain.

3. Modify the Modulation Index and Receiver Gain values with 0x23.

Write the ARC\_B register index: >>>0x090468010123

CR95HF reply: <<<0x0000

4. Read the Analog Configuration register (ARC\_B) value.

a) Write the ARC\_B register index at 0x01: >>>0x0903680001

CR95HF reply: <<<0x0000

b) Read the ARC\_B register value: >>>0x0803690100

**CR95HF reply**: <<<0x0123

#### **Modulation Index and Receiver Gain values**

**Table 22. Possible Modulation Index values** 

Code	1	2	3	4	5	6	D
Modulation Index (1)	10%	17%	25%	30%	33%	36%	95%

<sup>1.</sup> Characterized only using ISO/IEC 10373 test set-up.

Table 24. ARC\_B default code for available Reader protocols

Communication protocol	Default value	Recommended values for CR95HF demo board	Possible Modulation Index values (MS nibble)	Possible Receiver Gain values (LS nibble)
ISO/IEC 14443 Type A reader	0xDF	0xD1 or 0xD3	0xD	0x0, 0x1, 0x3, 0x7 or 0xF
ISO/IEC 14443 Type B reader	0x2F	0x20	0x1, 0x2, 0x3 or 0x4	0x0, 0x1, 0x3, 0x7 or 0xF
ISO/IEC 18092 reader	0x5F	0x20	0x1, 0x2, 0x3 or 0x4	0x0, 0x1, 0x3, 0x7 or 0xF
ISO/IEC 15693 reader 30%	0x53	0x50	0x4, 0x5 or 0x6	0x0, 0x1, 0x3, 0x7 or 0xF
ISO/IEC 15693 reader 100%	0xD3	0xD0	0xD	0x0, 0x1, 0x3, 0x7 or 0xF

### 5.8.2 Improving frame reception for ISO/IEC 14443 Type A tags

To improve CR95HF demodulation when communicating with ISO/IEC 14443 Type A tags, it is possible to adjust the synchronization between digital and analog inputs by fine-tuning the Timer Window (TimerW) value. This can be done using the Write Register (WRREG) command to set a new TimerW value (min. 0x50, max. 0x60). The recommended value is 0x56 or 0x58 when using the CR95HF demo board.

The default value of this parameter (0x52) is set by the Protocol Select command, but it can be overwritten using the WRREG command (0x09).

Table 25. WRREG command description (Timer Window)

Direction	Data	Comments	Example
	0x09 Command code		
Host to — CR95HF	0x03 <b>or</b> 0x04	Length of data	
	0x3A	Timer Window (TimerW) value	>>>0x09043A005804
	0x00 <b>or</b> 0x01	Flag Increment address or not after Write command	Set recommended TimerW value.
	0xxx	Set TimerW value (recommended value is 0x56 or 0x58)	
	0x04	TimerW value confirmation	
CR95HF to	0x00	Result code	<<<0x0000
Host	0x00	Length of data (= RegCount)	Register written

### 5.8.3 Improving RF reception for ISO/IEC 18092 tags

To improve CR95HF reception when communicating with ISO/IEC 18092 tags, it is possible to enable an AutoDetect filter to synchronize ISO/IEC 18092 tags with the CR95HF. This can be done using the Write Register (WRREG) command to enable the AutoDetect filter.

40/77 DocID018669 Rev 11

CR95HF Commands

By default, this filter is disabled after the execution of the Protocol Select command, but it can be enabled using the WRREG command ( $0 \times 09$ ).

# 5.9 BaudRate command (0x0A) description

This command changes the UART baud rate.

Table 26. BAUDRATE command description

Direction	Data	Comments	Example
	0x0A	Command code	
	0x01	Length of data	
Host to CR95HF	<baudrate></baudrate>	New Baud Rate = 13.56 /(2* <baudrate>+2) Mbps Baud rate 255: 13.56/512 ~26.48 Kbps 254: 13.56/510 ~26.59 Kbps 253: 13.56/508 ~26.7 Kbps 117: 13.56/236 ~57.7 Kbps (Value after power-up) 2: 13.56/6 ~2.26 Mbps 1: RFU 0: RFU</baudrate>	
CR95HF to Host	0x55	Code response of 0x55	<<<0x55 New baud rate is used to reply

### Caution:

If the BaudRate command is not correctly executed, the baud rate value will remain unchanged.

# 5.10 Echo command (0x55) description

The ECHO command verifies the possibility of communication between a Host and the CR95HF.

Table 27. Есно command description

Direction	Data	Comments	Example
Host to CR95HF	0x55	Command code	
CR95HF to Host	0x55	Code response	>>> 0x55: Sends an ECHO command <>< 0x55: Response to an ECHO command

POR	Power-on reset voltage			1.8		V

# 6.3 Power consumption characteristics

 $T_A = -25$ °C to 85°C, unless otherwise specified.

Table 30. Power consumption characteristics (VPS\_Main from 2.7 to 3.3 V)

Symbol	Parameter	Condition	Тур.	Max.	Unit
I <sub>CC</sub> (V <sub>PS</sub> ) Power-up	Supply current in power-up state	T <sub>A</sub> = 25°C	200	600	μΑ
I <sub>CC</sub> (V <sub>PS</sub> ) Hibernate	Supply current in Hibernate state	T <sub>A</sub> = 25°C	1	5	μΑ
I <sub>CC</sub> (V <sub>PS</sub> ) Sleep	Supply current in Sleep state	T <sub>A</sub> = 25°C	20	80	μA
I <sub>CC</sub> (V <sub>PS</sub> ) Ready	Supply current in Ready state	T <sub>A</sub> = 25°C	2.5	5.0	mA
I <sub>CC</sub> (V <sub>PS</sub> ) Tag Detect	Average supply current in Tag Detector state	T <sub>A</sub> = 25°C, 4 RF bursts per second	50	100	μА

The CR95HF supports two VPS\_TX supply ranges for RF drivers: 2.7V to 3.3V or 4.5V to 5.5V. Antenna matching circuit must be defined accordingly.

Table 31. Power consumption characteristics (VPS\_TX from 2.7 to 3.3 V)

Symbol	Parameter	Condition	Тур.	Max.	Unit
I <sub>CC</sub> RF (V <sub>PS_TX</sub> ) RF Field ON	Supply current in RF Field (Reader mode) (1)	T <sub>A</sub> = 25°C	70	100	mA
I <sub>CC</sub> RF (V <sub>PS_TX</sub> ) RF Field OFF	Supply current in RF Field (Ready mode) (2)	T <sub>A</sub> = 25°C		200	μΑ
I <sub>CC</sub> RF (V <sub>PS_TX</sub> ) Tag Detect	Peak <sup>(3)</sup> current during Burst detection	T <sub>A</sub> = 25°C	70	100	mA

<sup>1.</sup> Parameter measured using recommended output matching network. (Z load is 27  $\Omega$  and 0°).

<sup>3.</sup> The maximum differential input voltage between pins RX1 and RX2 (VRx1-Rx2) has a peak-peak of 18 V.

<sup>2.</sup> This consumption can be reduced to approximately 2 μA (typ.) by setting a control bit (bit HF2RF) to '1' using command 090468010710. In this case, Reader mode is not available.
To re-enable Reader mode, reset the HF2RF bit to '0' using the command 090468010700 or execute a new PROTOCOLSELECT command.

Electrical characteristics CR95HF

Table 32. Power consumption characteristics (VPS\_TX from 4.5 to 5.5 V)

Symbol	Parameter	Condition	Тур.	Max.	Unit
I <sub>CC</sub> RF (V <sub>PS_TX</sub> ) RF Field ON	Supply current in RF Field (Reader mode) (1)	T <sub>A</sub> = 25°C	120	200	mA
I <sub>CC</sub> RF (V <sub>PS_TX</sub> ) RF Field OFF	Supply current in RF Field (Ready mode) (2)	T <sub>A</sub> = 25°C		300	μΑ
I <sub>CC</sub> RF (V <sub>PS_TX</sub> ) Tag Detect	Peak <sup>(3)</sup> current during Burst detection	T <sub>A</sub> = 25°C	120	200	mA

- 1. Parameter measured using recommended output matching network. (Z load is 16  $\Omega$  and 0°).
- This consumption can be reduced to approximately 2 µA (typ.) by setting a control bit (bit HF2RF) to '1' using command 090468010710. In this case, Reader mode is not available.
   To re-enable Reader mode, reset the HF2RF bit to '0' using the command 090468010700 or execute a new PROTOCOLSELECT command.
- 3. The maximum differential input voltage between pins RX1 and RX2 (VRx1-Rx2) has a peak-peak of 18 V. This voltage can be limited by adding a damping resistor in parallel of the antenna or between ST\_R0 and Ground.

## 6.4 SPI characteristics

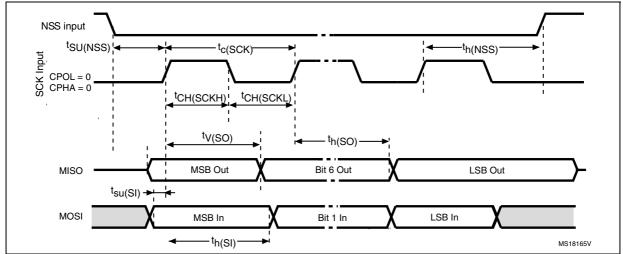

The CR95HF supports (CPOL = 0, CPHA = 0) and (CPOL = 1, CPHA = 1) modes.

Table 33. SPI interface characteristics

Symbol	Parameter	Condition	Min.	Max.	Unit

	Output power for 3V operation on pin VPS_TX (1)(2)		55		mW
Transmitte	er specifications (VPS_TX = 4.5 to 5.5 V)				
	Z <sub>OUT</sub> differential impedance between TX1 and TX2 <sup>(1)</sup>		16		Ω
	Output power for 5V operation on pin VPS_TX (1) (2)		230		mW
Receiver	pecifications				
	Small signal differential input resistance (Rx1/Rx2) <sup>(1)</sup>		100		kΩ
VRx1-Rx2	Differential input voltage between pins RX1 and RX2 <sup>(3)</sup>			18	V
	Small signal differential input capacitance (Cx1/Cx2) <sup>(1)</sup>		22		pF
	Sensitivity (106 Kbps data rate) <sup>(4)</sup>		8		mV

<sup>1.</sup> Maximum values based on design simulation and/or characterization results, and not tested in production.

<sup>2.</sup> Parameter measured on samples using recommended output matching network. (Z load is 27  $\Omega$  and 0°.)

This voltage can be limited by adding a damping resistor in parallel of the antenna or between ST\_R0 and Ground.

Based on ISO/IEC 10373-6 protocol measurement. The reader sensitivity corresponds to the load modulation value of the REQ reply sent by an ISO reference card when decoded by the CR95HF.

Electrical characteristics CR95HF

### 6.6 Oscillator characteristics

The external crystal used for this product is a 27.12 MHz crystal with an accuracy of ± 14 kHz.

Symbol	Parameter	Conditions	Min.	Тур.	Max.	Unit		
f <sub>XTAL</sub>	Oscillator frequency			27.12		MHz		
R <sub>F</sub>	Feedback resistor			2		МΩ		
С	Recommended load capacitance versus equivalent serial resistance of the crystal $(R_{\rm S})^{(3)}$	R <sub>S</sub> = 30 Ω		6		pF		
t <sub>SU(HFO)</sub> <sup>(4)</sup>	Startup time	V <sub>PS</sub> is stabilized		6	10	ms		

Table 35. HFO 27.12 MHz oscillator characteristics<sup>(1) (2)</sup>

- 1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.
- 2. Based on characterization, not tested in production.
- 3. The relatively low value of the R<sub>F</sub> resistor offers a good protection against issues resulting from use in a humid environment, due to the induced leakage and the bias condition change. However, it is recommended to take this point into account if the Host is used in tough humidity conditions.
- 4. t<sub>SU(HFO)</sub> is the startup time measured from the moment it is enabled (by software) to a stabilized 27.12 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

For  $C_{L1}$  and  $C_{L2}$ , it is recommended to use high-quality external ceramic capacitors in the 10 pF to 20 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see *Figure 16*).  $C_{L1}$  and  $C_{L2}$  are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ .

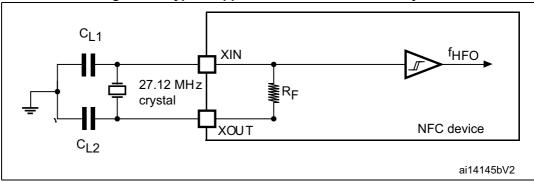

Figure 16. Typical application with a 27.12 MHz crystal

Note:

For  $C_{L1}$  and  $C_{L2}$  it is recommended to use high-quality ceramic capacitors in the 10 pF to 20 pF range selected to match the requirements of the crystal or resonator.  $C_{L1}$  and  $C_{L2}$ , are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of  $C_{L1}$  and  $C_{L2}$ .

Load capacitance  $C_L$  has the following formula:  $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$  where  $C_{stray}$  is the pin capacitance and board or trace PCB-related capacitance. Typically, it is between 2 pF and 7 pF.

# Appendix A Additional Idle command description

This section provides examples of use for the IDLE command.

The wake-up source is the third of the 16 bytes in the IDLE command. This byte specifies authorized Wake-up events. This revision now also provides the capability to set the LFO frequency in WFE mode.

The LFO frequency and the authorized wake-up source settings are stored in the Wake-up source register as the parameters of the IDLE command.

The Wake-up event is updated by the CR95HF when it exits WFE mode.

The contents of the Wake-up event register can be read using the Read Register command or in the CR95HF reply to the Idle command.

Table 38. Wake-up source register

Bits [7:6]	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
LFO frequency	RFU <sup>(1)</sup>	IRQ on pin SPI_SS	IRQ on pin IRQ_IN	RFU <sup>(1)</sup>	Tag Detect	Timeout

<sup>1.</sup> Must be set to '0'.

Table 39. Wake-up event register

Bits [7:6]	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
LFO frequency	RFU	IRQ on pin SPI_SS	IRQ on pin IRQ_IN	RFU	Tag Detect	Timeout

**Bits [7:6]** define the LFO frequency (f<sub>IFO</sub>):

00: 32 kHz 01: 16 kHz 10: 8 kHz 11: 4 kHz

<u>Bit 4:</u> When set, the CR95HF will wake up when an external interrupt (low level on pin SPI\_SS) is detected. This is useful for UART communication.

**Bit 3**: When set, the CR95HF will wake up when an external interrupt (low level on pin IRQ\_IN) is detected. This is useful for SPI communication. It is recommended to set this bit to '1' in order to recover in the event of a system crash.

**Bit 1**: When set, the CR95HF will wake up when a tag is detected in the RF field. This bit must also be set during Tag Detection calibration or during a Tag Detection sequence.

**Bit 0**: When set, the CR95HF will wake up and return to Ready state at the end of a predefined cycle. The Timeout (TO) value is defined by the MaxSleep and Wake-up period:

TO = (MaxSleep \*(WuPeriod+1)\*t<sub>RFF</sub>

 $t_{REF}$ = 256\* $t_L$  = 8 ms ( $f_{LFO}$  = 32 kHz), mean power consumption in Sleep mode is 25  $\mu$ A  $t_{REF}$ = 256\* $t_L$  = 64 ms ( $f_{LFO}$  = 4 kHz), mean power consumption in Sleep mode is 20  $\mu$ A

Note: Note that: 0x00 < MaxSleep < 0x1F.

This bit must be set when using the timer as a possible wake-up source. It must be set during Tag Detection Calibration to force a wake-up after the first Tag Detection trial.

# Appendix B Example of tag detection calibration process

The following script works on the DEMO\_CR95HF evaluation board and with the CR95HF development software available from the ST internet site.

This is a dichotomous approach to quickly converge to the DacDataRef value for which a wake-up event switches from tag detection to Timeout. In this process, only the DacDataH parameter is changed in successive Idle commands. And we look at the wake-up event reply to decide the next step.

```
00 01 02 corresponds to a Tag Detect,
00 01 01 corresponds to a Timeout.

# Appendix C Example of tag detection command using results of tag detection calibration

The following script works on the DEMO\_CR95HF evaluation board and with the CR95HF development software available from the ST internet site.

This is an example of a Tag Detection command when a tag is not present in the RF operating volume using the CR95HF:

```
>>> CR95HFDLL_STCMD, 01 070E0B21007801180020606064743F01
<<< 000101 Wake-up event = Timeout (0x01)
>>> CR95HFDLL_STCMD, 01 0803620100
<<< 000101
```

This is an example of a Tag Detection command when a tag is present in the RF operating volume using the CR95HF:

```
>>> CR95HFDLL_STCMD, 01 070E0B21007801180020606064743F01
<-< 000102 Wake-up event = Tag Detect (0x02)
>>> CR95HFDLL_STCMD, 01 0803620100
<-< 000102
```

# Appendix D Examples of CR95HF command code to activate NFC Forum and ISO/IEC 15693 tags

The following script works on the DEMO\_CR95HF evaluation board and with the CR95HF developement software available from the ST internet site.

This section provides examples of CR95HF command code used to activate NFC Forum and ISO/IEC 15693 tags using CR95HF development software.

CR95HFDLL\_STCMD: Is the standard CR95HF frame exchange command. In this command, the first byte 01 is not sent, it is only requested by the CR95HF development software in order to recognize if it is a user or service command.

CR95HFDLL\_SENDRECV: Is the encapsulated CR95HF SendReceive command for which command codes, number of bytes, and CRC are automatically appended to the parameter.

In this section,

- The CR95HF command overhead (command code, length of data and transmission flag) is in black.
- The Tag instruction is in blue.
- The CR95HF response overhead (result code, length of data and status) is in green.
- The Tag response is in red.

When the CRC append option is set in the Protocol Select command, the CRC is automatically appended by the CR95HF, but the CRC is not visible in the instruction log file.

When the CRC is present in the command or response, CRC reply is in *italics*.

The following symbols correspond to:

- >>> Frame sent by Host to CR95HF
- <<< Frame received by Host from CR95HF

CR95HF Revision history

# **Revision history**

Table 40. Document revision history

Date	Revision	Changes
30-Mar-2011	1	Initial release.
08-Sep-2011	2	Removed SSI_2 pin.
26-Oct-2011	3	Upgraded document from Preliminary Data to full Datasheet.
28-Oct-2011	4	Updated device revision information. Added Section 6.2: DC characteristics on page 43 and updated Section 6.3: Power consumption characteristics on page 43.
06-Jan-2012	5	Updated Table 12: List of <parameters> values for the ProtocolSelect command for different protocols on page 21, Table 17: Idle command description on page 31 and Section 5.6.5: Tag detection calibration procedure.  Updated Section 6.3: Power consumption characteristics, Section 6.4: SPI characteristics and Section 6.5: RF characteristics.  Updated Appendix B: Example of tag detection calibration process and Appendix C: Example of tag detection command using results of tag detection calibration.</parameters>
04-May-2012	6	Updated <i>Table 3: CR95HF operating modes and states on page 11.</i> Updated response to IDN command in <i>Section 5.3.</i> Added additional features in <i>Section 5.8: Write Register (WrReg) command (0x09) description.</i> Added optional parameter to increase maximum waiting time in NFC Forum Tag Type 3. Updated <i>Section 6.3: Power consumption characteristics</i> and added enhanced command for reducing consumption.
07-Jun-2012	7	Updated Section 6.3: Power consumption characteristics and enhanced command (HF2RF bit) for reducing consumption.
24-Jul-2012	8	Changed Response example to Command example in <i>Table 14:</i> List of <data> Send values for the SendRecv command for different protocols. Updated <i>Table 2: CR95HF pin descriptions</i>.</data>
09-Jun-2014	9	Updated Section 3.2: Startup sequence and Table 28: Absolute maximum ratings on page 42.

Revision history CR95HF

Table 40. Document revision history (continued)

Date	Revision	Changes
10-Oct-2014	10	Corrected reporting of 4-bit frames in ISO/IEC 14443-A mode. Internal data exchange buffer is now 528 bytes. Now able to directly manage the value of Parity bit included in a standard ISO/IEC 14443-A frame. Added optional parameters for use in Protocol Select command. Mains supply extended to 5V range. Added enhanced error code list.
09-Nov-2016	11	Updated:  - Features  - Table 6: Possible error codes and their meaning  - Table 19: Summary of Idle command parameters  - Section 7: Package information  - Figure 17: VFQFPN32 - 32-pin, 5x5 mm, 0.5 mm pitch very thin profile fine pitch quad flat package outline  - Table 36: VFQFPN32 - 32-pin, 5x5 mm, 0.5 mm pitch very thin profile fine pitch quad flat package mechanical data  Added:  - Figure 18: VFQFPN32 - 32-pin, 5x5 mm, 0.5 mm pitch very thin profile fine pitch quad flat package recommended footprint
